

SHORT NOTES: CLASS 9 CHAPTER 1: NUMBER SYSTEMS

REAL NUMBERS:

- a) Real numbers and imaginary numbers together form number systems.
- b) Real numbers are the set of natural numbers, whole numbers, integers, rational and irrational numbers. Denoted by R

1. RATIONAL NUMBERS:

- a) These are those numbers that can be expressed in the form of fractions i.e., p/q where p and q are integers and $q \neq 0$.
- b) For example: 35, -29, -34 etc. <http://www.physicsinduction.com>
- c) Denoted by Q
- d) There are infinitely many rational numbers between any two rational numbers.

2. IRRATIONAL NUMBERS:

- a) Numbers which are not rational i.e., which cannot be expressed in the form of p/q where p and q are integers and $q \neq 0$. For example: e.g., $\sqrt{2}$, $\sqrt{5}$, π , ...etc.

3. NATURAL NUMBERS:

- a) These are counting numbers starting from 1.
- b) The set $\{1, 2, 3, 4, 5, 6, 7, \dots\}$ is called natural numbers.
- c) Denoted by N

4. WHOLE NUMBERS:

- a) These are the set of natural numbers including 0.
- b) The set $\{0, 1, 2, 3, 4, 5, 6, \dots\}$ is called whole numbers.
- c) Denoted by W

5. INTEGERS:

- a) These are the set of negative numbers, positive numbers, and 0 excluding fractions.
- b) The set $\{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$ is called integers.
- c) Denoted by Z

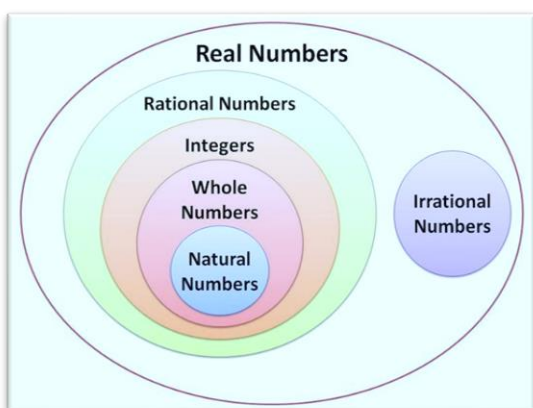

6. PRIME NUMBERS: No factors other than 1 and the number itself.

7. COPRIMES: Two numbers a and b are said to be coprimes if $HCF(a, b) = 1$

8. COMPOSITE NUMBERS: More than two factors.

Note:

- a) All integers are rational numbers. <http://www.physicsinduction.com>
- b) All whole numbers are integers but all integers are not whole numbers.
- c) All natural numbers are whole numbers but all whole numbers are not natural numbers

<http://www.physicsinduction.com>

DECIMAL REPRESENTATION OF A RATIONAL NUMBER:

1. **Terminating decimal expression:** $\frac{7}{8} = 0.875$
2. **Non-terminating, repeating decimal expression:** $\frac{9}{11} = 0.818181.....$
3. **Non-terminating, non-repeating decimal expression:** $\pi = 3.141592653589793283.....$
 - Decimal expressions of rational numbers are either terminating or non-terminating, repeating.
 - Decimal expressions of irrational numbers are either non-terminating and non-repeating.

HOW TO FIND RATIONAL NUMBERS:

<http://www.physicsinduction.com>

REPRESENTING REAL NUMBERS ON THE NUMBER LINE/SUCCESSIVE MAGNIFICATION:

IRRATIONAL NUMBERS ON THE NUMBER LINE:

TO DRAW: $\sqrt{2}$ on the number line. <http://www.physicsinduction.com>

STEPS OF CONSTRUCTION:

- Draw a number line.
- Mark the number 1 on the number line as point A.
- Draw a perpendicular at A using a compass such that ray AX \perp OA
- With A as centre and radius 1 unit, draw an arc at AX. Mark the point as B
- Join OB. OB = $\sqrt{2}$ units. <http://www.physicsinduction.com>

With O as center and OB as radius, draw an arc, cutting the number line at point P. OP = $\sqrt{2}$ units.

OPERATIONS ON REAL NUMBERS:

Real numbers can be added, subtracted, multiplied, and divided.

- Rational numbers satisfy the commutative, associative, and distributive laws for addition and multiplication. Moreover, if we add, subtract, multiply, or divide (except by zero) two rational numbers. We still get a rational number (i.e., rational numbers are 'closed' with respect to addition, subtraction, multiplication, and division). <http://www.physicsinduction.com>
- Irrational numbers also satisfy the commutative, associated, and distributive laws for addition and multiplication. However, the sum, difference, quotients, and products of irrational numbers are not always irrational.
e.g., $\sqrt{5} + (-\sqrt{5}) = 0$
 $\sqrt{15}/\sqrt{15} = 1$ is rational.
 $\sqrt{3}$ is irrational.
Hence, $(5 + \sqrt{3})$ is also irrational ($\sqrt{3}$ has a non-terminating, non-recurring decimal expansion).

PHYSICS INDUCTION

www.physicsinduction.com

SOME COMMON FACTS OF OPERATION ON REAL NUMBERS ARE: <http://www.physicsinduction.com>

- a) The sum or difference between a rational number and an irrational number is irrational.
- b) The product or quotient of a non-zero rational number with an irrational number is irrational.
- c) If we add, subtract, multiply, or divide two irrationals, then the result may be rational or irrational.

RATIONALIZING DENOMINATOR:

- a) When the denominator is irrational then the process of converting the denominator to rational is called rationalizing the denominator.
- b) It is obtained by multiplying the numerator and denominator by the irrational term present in the denominator but with the opposite sign.
- c) To rationalise the denominator of $1/\sqrt{a+b}$, it is multiplied by $\sqrt{a-b}/\sqrt{a-b}$, where a and b are integers. <http://www.physicsinduction.com>

LAWS OF EXPONENTS FOR REAL NUMBERS:

- a) $x^0 = 1$
- b) $x^{-m} = 1/x^m$
- c) $x^m \cdot x^n = x^{m+n}$
- d) $x^m/x^n = x^{m-n}$
- e) $(x^m)^n = x^{mn}$
- f) $x^m y^m = (xy)^m$
